

NAME

CIDH – CUTER tool to evaluate the Hessian of a problem function.

SYNOPSIS

CALL CIDH(N, X, IPROB, LH1, H)

DESCRIPTION

The CIDH subroutine evaluates the Hessian matrix of either the objective function or a constraint function for the problem decoded into OUTSDIF.d at the point X, and possibly its gradient in the constrained minimization case. The matrix is stored as a dense matrix.

ARGUMENTS

The arguments of CIDH are as follows

N [in] - integer

the number of variables for the problem,

X [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

IPROB [in] - integer

the number of the problem function to be considered. If IPROB = 0, the Hessian of the objective function will be evaluated, while if IPROB = i > 0, that of the i-th constraint will be evaluated,

LH1 [in] - integer

the actual declared size of the leading dimension of H (with LH1 no smaller than N),

H [out] - real/double precision

a two-dimensional array which gives the value of the required Hessian matrix.
