NAME

UDH – CUTEr tool to evaluate the Hessian matrix.

SYNOPSIS

CALL UDH(N, X, LH1, H)

DESCRIPTION

The UDH subroutine evaluates the Hessian matrix of the objective function of the problem decoded into OUTSDIF.d at the point X in the case where the only possible constraints are bound constraints. This Hessian matrix is stored as a dense matrix.

ARGUMENTS

The arguments of UDH are as follows

N [in] - integer

the number of variables for the problem,

X [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

LH1 [in] - integer

the actual declared size of the leading dimension of H (with LH1 no smaller than N),

H [out] - real/double precision

a two-dimensional array which gives the value of the Hessian matrix of the objective function evaluated at X.
